MEMORANDUM FOR : Executive Secretary, UAB

SUBJECT : Sanitization of TALENT Photography in
the Far East: Hawaii [redacted]

25X1A

1. Attention is called to the fact that it probably would be a good idea to introduce some review and policing of sanitization processes applicable to TALENT photography. Our discussions at the CINCPACFLT PI center with Captain Taylor and his staff suggest that their interpretation of instructions received from ONI in the preparation of target folder materials is much more stringent than the application by SAC in the 100 series, for example. It is also obvious that there is a need for greater coordination among the Services in the target folder program in order to ensure against unnecessary labor in the duplication and sanitization work already in progress.

25X1A

2. It is of considerable satisfaction to note that [redacted] is entirely on top of the sanitization problem viz. the CHICOM materials. From a duplicate positive, an enlargement is made, culminating in a 9 x 18 negative. Classification and grease markings are then applied with the result being a print readily conforming to the specifications of the sanitization procedure. Because of limited capacity and because of limited needs, sanitization work has not been extensive on 6019, the only mission on which a full duplicate positive exists.
